

TOGETHER, LET'S TRY AND CHANGE THE FUTURE OF ALZHEIMER'S DISEASE

Join a real-world research study for early Alzheimer's disease today

Alzheimer's disease (AD) can cause symptoms such as memory loss, confusion, and trouble finding the right words or thoughts. The TRAILBLAZER-REAL US Study is looking to learn more about how well a new medication (study medication), when given alongside the usual care, works compared with usual care alone for people with early symptoms of AD in the real world.

You may be able to take part if you:

- are 60 years of age or older
- are under care for presumed mild cognitive impairment or mild dementia stage of AD
- have a reliable study partner who you are in frequent contact with (and who will be available by telephone at designated times).

If you take part in the TRAILBLAZER-REAL US Study, you will receive either the study medication along with your usual care, or just usual care alone:

- Usual care represents the standard of care that you would receive outside of a research setting.
